Modernize Your Legacy Systems at Speed

FAST2

Quickly migrate and consolidate billions of documents from on-premise to the cloud

Migration is a critical step in the move to the cloud, but modern migration projects are no longer a lift and shift endeavor. Organizations must find feature parity with their new cloud-based platforms, and maintain critical file and data integrity as a part of the migration process.

Whether you're looking to move away from an expensive, difficult-to-maintain legacy system or looking for a simple way to move on-premises solutions to the cloud, Fast2 streamlines the entire migration process from a range of different systems with a simplified, comprehensive mechanism to ensure the success of your legacy modernization project at speed.

Securely Conduct Mass Migrations at Speed

Migrating your business content can be risky and disruptive for your organization. Fast2 offers a highly scalable architecture that significantly lowers processing times, migrating mass volumes of content without sacrificing security and without risk of data-loss. Out-of-the-box integrations let organizations easily move content and data between a range of leading business applications and ECM systems in a matter of days.

Meet Complex Business Requirements

The success of a migration depends on careful mapping of source and destination data and fields.

Fast2 provides a catalog of over 100 tasks to easily map data, without the need for heavy coding of custom scripts. The platform uses a standard API that allows for simple configuration of custom tasks to meet even the most complex business requirements.

Accelerate Legacy Transformation

Migration is the first, most critical step of any successful digital transformation project. Fast2 lets you manage the migration of files, metadata, version history, and permissions in one streamlined process so that you can get the most out of your new cloud-based system. Built-in insights help optimize your migration in real-time, while minimizing business impact.

Migrate millions of files per day

- Migrate content, keywords, versions, permissions, users, and annotations
- Migration of cloud and on-premise solutions
- Convert large volumes of files from one format to another

Move from any source system

- Map and move data from ECM systems, business applications, emails, and more
- Choose from a catalogue of pre-configured templates or build your own connectors
- Configure custom rules to migrate content over time or as needed

Track activity with built-in Insights

- Make intelligent assessments using built-in insights
- Track and monitor migration progress with advanced reports
- Ensure data security and content integrity
